

Direct MadGraph σ vs. g^2 -scaling prediction
(benchmark: $m_H=150$ GeV, $\tan\beta=3\times 10^5$; $A \times \varepsilon(\text{ctau})$ not applied)

Blue shading: m_H axis (M2 retuned to hold theory validity; $g_{hH_2H_2}$ unchanged). Orange shading: $\tan\beta$ axis (M2, m_H fixed; $g_{hH_2H_2}$ unchanged).
